

Present situation of Japan's food self-sufficiency potential

[FY2013 (estimated values)]

When planting crops, etc. in currently arable land

When planting crops, etc. in reusable abandoned farmland (*2)

o Actual measured values for domestically produced calories (numerator of food self-sufficiency ratio: on a supply basis)

*1: Estimated required energy per person per day refers to the estimated value, over a short period of time, for energy required to maintain a person's weight at its current level (without weight gain or loss).

*2: Statistical values for abandoned farmland are compiled each December, so the data used for calculation is from the preceding fiscal year.

(unit: kcal per person per day)

Change in food self-sufficiency potential index

(unit: daily per capita kcal)
